# MATH 221, Fall 2016 - Homework 10 Solutions

Due Tuesday, November 22

## Section 3.1

Page 168, Problem 15:

Using the diagonal product method results in:

$$\det A = 3(3)(-1) + (0)(2)(0) + (4)(2)(5) - (0)(3)(4) - (5)(2)(3) - (-1)(2)(0) = -9 + 0 + 40 - 0 - 30 + 0 = 1$$

Page 168, Problem 33:

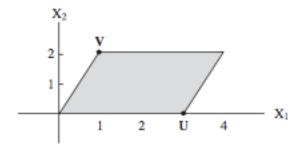

$$EA = \left[ \begin{array}{cc} 0 & 1 \\ 1 & 0 \end{array} \right] \left[ \begin{array}{cc} a & b \\ c & d \end{array} \right] = \left[ \begin{array}{cc} c & d \\ a & b \end{array} \right], \ \det EA = bc - ad,$$

$$\det E = -1, \, \det A = ad - bc,$$

$$\det E * \det A = -1 * (ad - bc) = bc - ad$$

Page 168, Problem 41:

The graph of the parallelogram is:

The formula for the area of a parallel goram is A = bh, where b is the length of the base and h is height. From this picture, it is clear that the height is 2 and the base is 3, so the area is 6.

The determinant of  $[\mathbf{u}\,\mathbf{v}]$  is equal to 6.

If the first entry of v is changed, the area of the parallelogram is still 6 and the determinant of the matrix is still 6.

### Section 3.2

Page 175, Problem 20:

Transforming the matrix 
$$\begin{bmatrix} a+d & b+e & c+f \\ d & e & f \\ g & h & i \end{bmatrix} \text{ by } -R_2+R_1 \rightarrow R_1 \text{ yields } \begin{bmatrix} a & b & c \\ d & e & f \\ g & h & i \end{bmatrix}. \text{ Because } \begin{vmatrix} a & b & c \\ d & e & f \\ g & h & i \end{vmatrix} = 7$$

and the only row-operations on the matrix were adding a multiple of a row,  $\begin{vmatrix} a+d & b+e & c+f \\ d & e & f \\ g & h & i \end{vmatrix} = 7.$ 

Page 175, Problem 21:

Use row-operations to reduce the matrix:

$$\begin{bmatrix} 2 & 3 & 0 \\ 1 & 3 & 4 \\ 1 & 2 & 1 \end{bmatrix} : R_3 \leftrightarrow R_1 : \begin{bmatrix} 1 & 2 & 1 \\ 1 & 3 & 4 \\ 2 & 3 & 0 \end{bmatrix} : -R_1 + R_2 \rightarrow R_2 : \begin{bmatrix} 1 & 2 & 1 \\ 0 & 1 & 3 \\ 2 & 3 & 0 \end{bmatrix} : -2R_1 + R_3 \rightarrow R_3 : \begin{bmatrix} 1 & 2 & 1 \\ 0 & 1 & 3 \\ 0 & -1 & -2 \end{bmatrix} : -2R_1 + R_2 \rightarrow R_3 : \begin{bmatrix} 1 & 2 & 1 \\ 0 & 1 & 3 \\ 0 & -1 & -2 \end{bmatrix} : -2R_1 + R_3 \rightarrow R_3 : \begin{bmatrix} 1 & 2 & 1 \\ 0 & 1 & 3 \\ 0 & -1 & -2 \end{bmatrix} : -2R_1 + R_3 \rightarrow R_3 : \begin{bmatrix} 1 & 2 & 1 \\ 0 & 1 & 3 \\ 0 & -1 & -2 \end{bmatrix} : -2R_1 + R_3 \rightarrow R_3 : \begin{bmatrix} 1 & 2 & 1 \\ 0 & 1 & 3 \\ 0 & -1 & -2 \end{bmatrix} : -2R_1 + R_3 \rightarrow R_3 : \begin{bmatrix} 1 & 2 & 1 \\ 0 & 1 & 3 \\ 0 & -1 & -2 \end{bmatrix} : -2R_1 + R_3 \rightarrow R_3 : \begin{bmatrix} 1 & 2 & 1 \\ 0 & 1 & 3 \\ 0 & -1 & -2 \end{bmatrix} : -2R_1 + R_3 \rightarrow R_3 : \begin{bmatrix} 1 & 2 & 1 \\ 0 & 1 & 3 \\ 0 & -1 & -2 \end{bmatrix} : -2R_1 + R_3 \rightarrow R_3 : \begin{bmatrix} 1 & 2 & 1 \\ 0 & 1 & 3 \\ 0 & -1 & -2 \end{bmatrix} : -2R_1 + R_3 \rightarrow R_3 : \begin{bmatrix} 1 & 2 & 1 \\ 0 & 1 & 3 \\ 0 & -1 & -2 \end{bmatrix} : -2R_1 + R_3 \rightarrow R_3 : \begin{bmatrix} 1 & 2 & 1 \\ 0 & 1 & 3 \\ 0 & -1 & -2 \end{bmatrix} : -2R_1 + R_3 \rightarrow R_3 : \begin{bmatrix} 1 & 2 & 1 \\ 0 & 1 & 3 \\ 0 & -1 & -2 \end{bmatrix} : -2R_1 + R_3 \rightarrow R_3 : \begin{bmatrix} 1 & 2 & 1 \\ 0 & 1 & 3 \\ 0 & -1 & -2 \end{bmatrix} : -2R_1 + R_3 \rightarrow R_3 : \begin{bmatrix} 1 & 2 & 1 \\ 0 & 1 & 3 \\ 0 & -1 & -2 \end{bmatrix} : -2R_1 + R_3 \rightarrow R_3 : \begin{bmatrix} 1 & 2 & 1 \\ 0 & 1 & 3 \\ 0 & -1 & -2 \end{bmatrix} : -2R_1 + R_3 \rightarrow R_3 : \begin{bmatrix} 1 & 2 & 1 \\ 0 & 1 & 3 \\ 0 & -1 & -2 \end{bmatrix} : -2R_1 + R_3 \rightarrow R_3 : \begin{bmatrix} 1 & 2 & 1 \\ 0 & 1 & 3 \\ 0 & -1 & -2 \end{bmatrix} : -2R_1 + R_3 \rightarrow R_3 : \begin{bmatrix} 1 & 2 & 1 \\ 0 & 1 & 3 \\ 0 & -1 & -2 \end{bmatrix} : -2R_1 + R_3 \rightarrow R_3 : \begin{bmatrix} 1 & 2 & 1 \\ 0 & 1 & 3 \\ 0 & -1 & -2 \end{bmatrix} : -2R_1 + R_3 \rightarrow R_3 : \begin{bmatrix} 1 & 2 & 1 \\ 0 & 1 & 3 \\ 0 & -1 & -2 \end{bmatrix} : -2R_1 + R_3 \rightarrow R_3 : \begin{bmatrix} 1 & 2 & 1 \\ 0 & 1 & 3 \\ 0 & -1 & -2 \end{bmatrix} : -2R_1 + R_3 \rightarrow R_3 : \begin{bmatrix} 1 & 2 & 1 \\ 0 & 1 & 3 \\ 0 & -1 & -2 \end{bmatrix} : -2R_1 + R_3 \rightarrow R_3 : \begin{bmatrix} 1 & 2 & 1 \\ 0 & 1 & 3 \\ 0 & -1 & -2 \end{bmatrix} : -2R_1 + R_3 \rightarrow R_3 : \begin{bmatrix} 1 & 2 & 1 \\ 0 & 1 & 3 \\ 0 & -1 & -2 \end{bmatrix} : -2R_1 + R_2 \rightarrow R_3 : \begin{bmatrix} 1 & 2 & 1 \\ 0 & 1 & 3 \\ 0 & -1 & -2 \end{bmatrix} : -2R_1 + R_2 \rightarrow R_3 : \begin{bmatrix} 1 & 2 & 1 \\ 0 & 1 & 3 \\ 0 & -1 & -2 \end{bmatrix} : -2R_1 + R_2 \rightarrow R_3 : \begin{bmatrix} 1 & 2 & 1 \\ 0 & 1 & 3 \\ 0 & -1 & -2 \end{bmatrix} : -2R_1 + R_2 \rightarrow R_3 : \begin{bmatrix} 1 & 2 & 1 \\ 0 & 1 & 3 \\ 0 & -1 & -2 \end{bmatrix} : -2R_1 + R_2 \rightarrow R_3 : \begin{bmatrix} 1 & 2 & 1 \\ 0 & 1 & 3 \\ 0 & -1 & -2 \end{bmatrix} : -2R_1 + R_2 \rightarrow R_3 : \begin{bmatrix} 1 & 2 & 1 \\ 0 & 1 & 3 \\ 0 & -1 & -2 \end{bmatrix} : -2R_1 + R_2 \rightarrow R_3 : \begin{bmatrix} 1 & 2 & 1$$

 $R_2 + R_3 \rightarrow R_3 : \begin{bmatrix} 1 & 2 & 1 \\ 0 & 1 & 3 \\ 0 & 0 & 1 \end{bmatrix}$ . Thus, the determinant is -1 (because of the row-interchange at the beginning).

Because the determinant does not equal 0, the matrix is invertible.

Page 175, Problem 22:

Use row-operations to reduce the matrix:

$$\left[ \begin{array}{ccc} 5 & 0 & -1 \\ 1 & -3 & -2 \\ 0 & 5 & 3 \end{array} \right] : R_1 \leftrightarrow R_2 : \left[ \begin{array}{ccc} 1 & -3 & -2 \\ 5 & 0 & -1 \\ 0 & 5 & 3 \end{array} \right] : -5R_1 + R_2 \rightarrow R_2 : \left[ \begin{array}{ccc} 1 & -3 & -2 \\ 0 & 15 & 9 \\ 0 & 5 & 3 \end{array} \right] :$$

 $-\frac{1}{3}R_2 + R_3 \to R_3: \begin{bmatrix} 1 & 3 & -2 \\ 0 & 15 & 9 \\ 0 & 0 & 0 \end{bmatrix}.$  Because the determinant is equal to 0, the matrix is not invertible.

Page 176, Problem 35:

By Theorem 6, 
$$\det U^T U = \det U^T * \det U$$
. By Theorem 5,  $\det U^T = \det U$ , so

$$\det U^T U = (\det U)^2. \text{ Since } U^T U = I, \ 1 = \det I = \det U^T U = (\det U)^2. \text{ Therefore, } \det U = \pm 1.$$

Page 176, Problem 37:

Straightforward calculation of det A = 3(1) - 0(6) = 3 and det B = 2(4) - 0(5) = 8 shows that

2

$$(\det A)(\det B) = 3(8) = 24$$
. The determinant of the matrix product  $AB = \begin{bmatrix} 6 & 0 \\ 17 & 4 \end{bmatrix}$  is

$$\det AB = 6(4) - 0(17) = 24$$
. Thus,  $24 = \det AB = (\det A)(\det B) = 24$ .

#### Page 176, Problem 40:

Straightforward calculations using the properties of determinants:

• 
$$\det AB = (\det A)(\det B) = (-1)(2) = -2$$

• 
$$\det B^5 = (\det B)^5 = 2^5 = 32$$

• 
$$\det 2A = 2^4 \det A = 16(-1) = -16$$

- NOTE: When A is an  $n \times n$  matrix,  $\det(rA) = r^n \det A$ , by factoring an r out of each of the n rows.

• 
$$\det A^T A = (\det A^T)(\det A) = (\det A)(\det A) = -1(-1) = 1$$

• 
$$\det B^{-1}AB = (\det B^{-1})(\det A)(\det B) = (\frac{1}{2})(-1)(2) = -1$$

- NOTE: 
$$BB^{-1} = I \Longrightarrow \det BB^{-1} = (\det B)(\det B^{-1}) = \det I = 1$$
, so  $\det B^{-1} = \frac{1}{\det B}$ 

#### Page 176, Problem 41:

Calculate each determinant: 
$$\det A = (a+e)(d) - (b+f)(c) = ad + de - bc - cf = ad - bc + ed - fc$$
,

$$\det B = ad - bc$$
,  $\det C = ed - fc$ . It is clear then that  $\det A = \det B + \det C$
